(We are HERE)

DWeb Stack

Bandwith: Sentinel DVPN, Orchid

Storage: Filecoin, Swarm, Siacoin, Arweave, Swarm

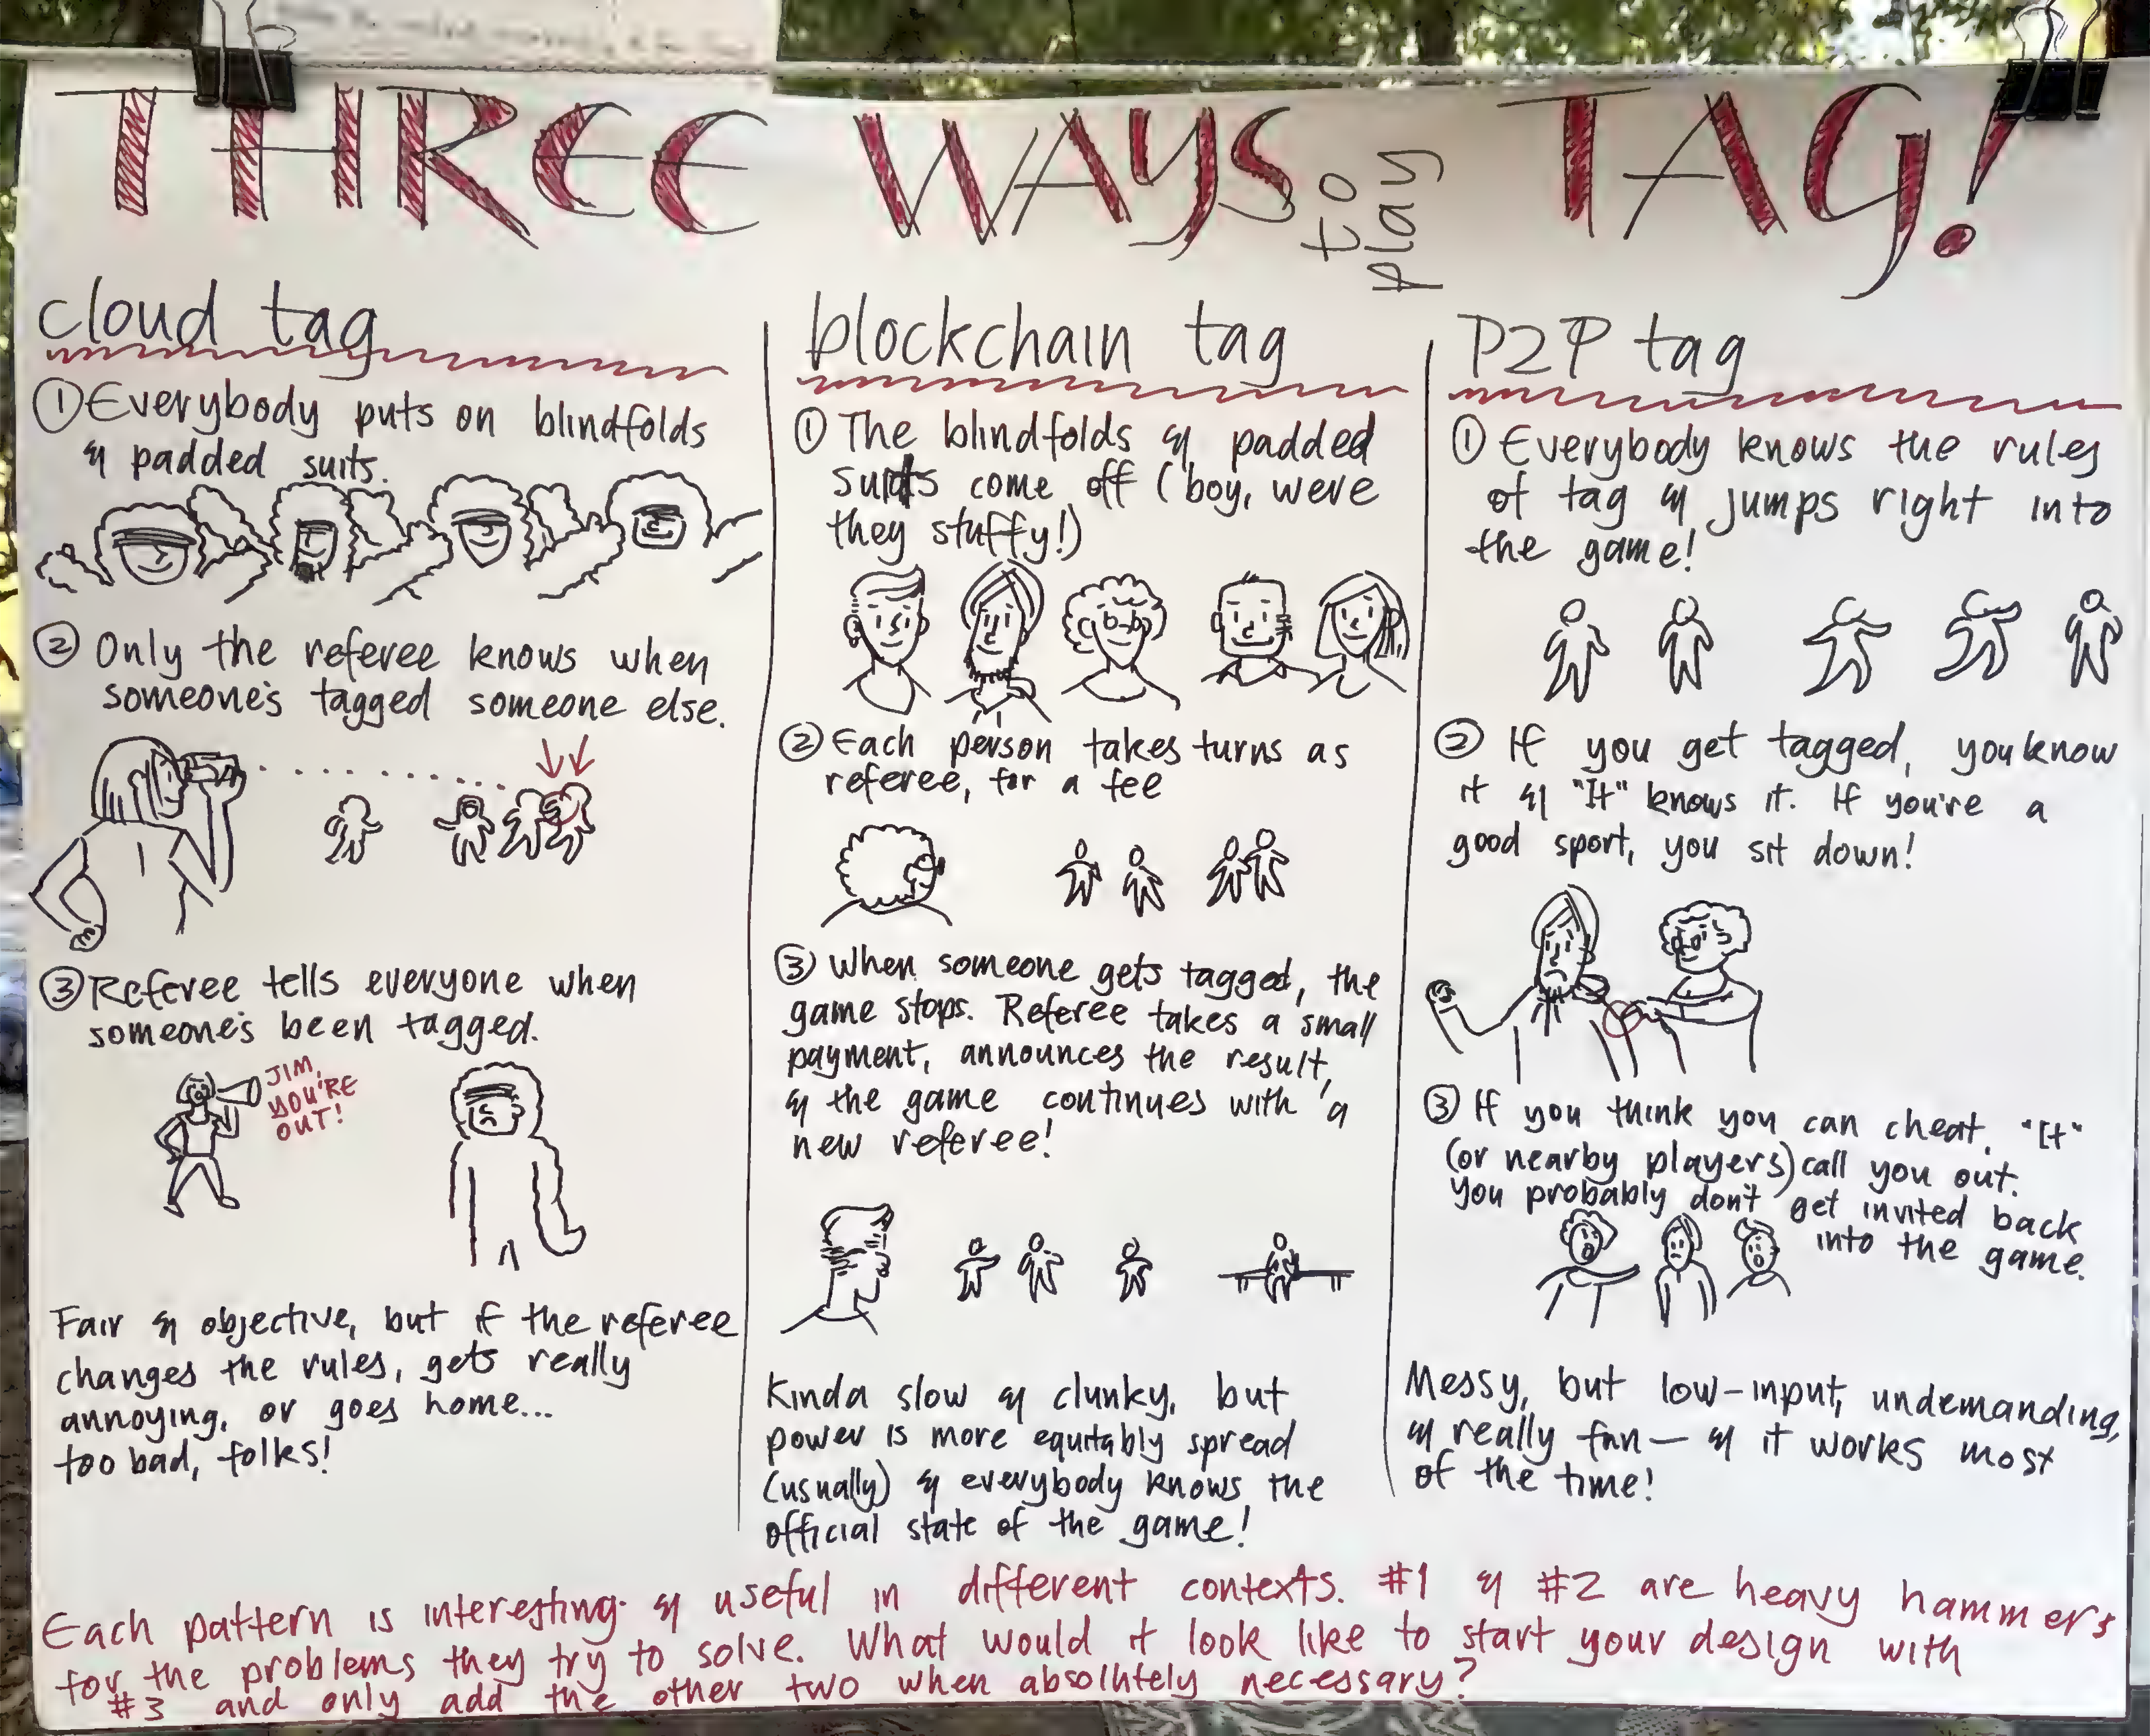

Compute: Akash

Namespaces: ENS, Handshake (HNS)

HOT Takes

Stop building protocols, build public blockchains.

Fact: The DWeb needs crypto more than crypto needs the DWeb.

THREE WAYS to play TAG!
cloud tag
① Everybody puts on blindfolds & padded suits.
② Only the referee knows when someone's tagged someone else.
③ Referee tells everyone when someone's been tagged.
JIM, YOU'RE OUT!
Fair & objective, but if the referee changes the rules, gets really annoying, or goes home... too bad, folks!
blockchain tag
① The blindfolds & padded suits come off (boy, were they stuffy!)
② Each person takes turns as referee, for a fee
③ When someone gets tagged, the game stops. Referee takes a small payment, announces the result, & the game continues with a new referee!
Kinda slow & clunky, but power is more equitably spread (usually) & everybody knows the official state of the game!
P2P tag
① Everybody knows the rules of tag & jumps right into the game!
② If you get tagged, you know it & "It" knows it. If you're a good sport, you sit down!
③ If you think you can cheat, "It" (or nearby players) call you out. You probably don't get invited back into the game.
Messy, but low-input, undemanding, & really fun — & it works most of the time!
Each pattern is interesting & useful in different contexts. #1 & #2 are heavy hammers for the problems they try to solve. What would it look like to start your design with #3 and only add the other two when absolutely necessary?
